SOCopy – The tool for validated data transfer

Trouble fulfilling PI 041-1 PIC/S guidance on data integrity (Yes it is the #1 on page 27 the one talking about validated data transfer), and similar regulatory requirements?

SOCopy is a simple and flexible transfer program that can copy files from one location to another, and generate PDF reports that documents the transfer process. The validation of the transfer process is ideal for use in GxP-driven industries.

Key features of the SOCopy solution:

- No installation required. Can run locally or from a USB-drive
- No internet access is required
- Can trigger on time, file age or file properties changing
- Comprehensive samples of batch scripts with examples and guides are available
- Possible to set up for automated data backup
- Documentation is available. URS and FS data are all available for your need
- Template tests are available. IQ/OQ test steps are available for your need

Examples of SOCopy usage:

- Transfer generated batch data from production equipment to a secure file-share server
- Audit trail archiving
- Automated and documented daily backup
- Coping raw-data before the system deletes them
- Documentation of the transfer processes

System requirements:

- Windows XP or later
- .NET Framework 3.5
- Adequate network connection

Setup

SOCopy utilizes DOS batch scripts and the scheduler, and can be setup to transfer any kind of file not locked by another program, to destination paths defined by the user. The transfer process is very flexible, and can be setup to reflect the needs of the user.

Setup can be provided as either as a DIY downloadable installation kit or as part of a project.

SOCopy disclaimer

The SOCopy software is developed and documented by Stage One Computing A/S. Stage One Computing have all the copyrights on the software and the documentation.

Stage One Computing has provided this program designed for validated data transfer. The program is intended for use within a GxP regulated area, but is provided as a "qualify yourself" application. This means that Stage One Computing vouches for the functionality, and has tested the application under IT laboratory conditions. It is however the responsibility of the user of the application to validate the in situ installation under the conditions that is provided in the target environment. Further the functionality and services provided by other applications, the operating system, and the batch scripts designed for any specific implementation of SOCopy, is not the responsibility of Stage One Computing.
